TEAM REVIEW / 09 NOVEMBER 2026

Milestone 1: team handoff

Travel Planning and Booking Platform | Reviewed develop f9742f7, including PR59. This document lists unfinished backend criteria and the next actions for all eight owners.

Verified snapshot

- Production TypeScript build: PASS on f9742f7.
- Independent full regression: 557/557 tests passed; 0 failed, 0 skipped. 64 suites; duration 1266.5 seconds. Fresh test compilation passed.
- Merged progress includes hotel groups/checkout completion/transactional holds, real itinerary hotel search, itinerary PDF export, and the new multi-airport flight-search provider. Do not assign these again as missing implementations.

Priority findings

- R1: Kiki + Gamila - itinerary flight search still returns 503 through its pending binding.
- R2: Gamila + Kiki - multi-airport search can offer a round trip rejected by the booking service.
- R3/R4: Osama + Lama, with Arwa - stale hotel eligibility during holds; room deactivation despite pending reservations.
- R5: Arwa - failed audit persistence can leave a committed suspension without audit/notification recovery.
- R6/R7: Lama - undersized-room prices can pass hotel filters; impossible/past search dates are accepted.

Meaning of the results

- A green suite certifies covered tests, not every acceptance criterion. Per-owner pages distinguish implemented work, remaining mandatory criteria and optional work. No shared Atlas data was used or changed.
- M2 pages/navigation/responsive styling are not missing M1 backend features. The full official text and workbook cells remain in the existing ownership matrix.

SHARED CRITICAL PATH

Connect the domain owners

Malak coordinates agreements; each owner retains their schemas and business logic.

Resolve in this order

- Osama + Hicham: HOTEL policy lookup, verified confirmation/reference, all-room HELD-to-BOOKED conversion, cancellation/refund and expiry PaymentIntent cancellation.
- Ismail + Hicham + Arwa: replace production BOOKING_PAYMENTS and BOOKING_NOTIFICATIONS pending adapters. Fixture substitutions do not activate production behavior.
- Malak + Ismail + Osama + Hicham: agree atomic confirmation/deactivation ordering. Both upcoming-confirmed checks now exist; independent reads followed by deactivation still race payment confirmation.
- Kiki + Gamila: bind the real itinerary flight adapter and verify matching return airports, same-day timing and global pagination.
- Kiki + Arwa: itinerary reports/moderation. Kiki + Hicham: public author itineraries. Malak + Kiki: supplied attraction catalog/seed responsibility.

Git, contracts and secrets

- Feature/fix branch from current develop, synchronize, test, review PR back to develop. No protected-branch implementation or force push. Promote to main through a reviewed stable milestone release.
- Agree shared schemas, enum names, interfaces and new env names first. Reuse guards/search/payment services. Commit .env.example variable names only; never credentials or .env.

Workflow coverage

- Six logs exist: Kiki 16001313; Hicham 16002290; Arwa 16002483; Lama 16002622; Malak 16003651; Osama 16005523. Gamila and Ismail must add their own confirmed-ID logs.
- One continuous file per student: sanitized prompts, requirement IDs, decisions, real checks, failures/corrections, limitations and PR/review outcome. Each student must record their own understanding; an existing file alone does not prove the workflow is complete.

PERSON 1 / MALAK / 16003651

Authentication and users

Core auth, password/profile handling, cookie guards and ACC-11 integration are merged.

Mandatory work remaining

- ACC-12: self-deactivation, eligibility, session revocation and required content hiding/anonymization. Include ongoing confirmed stays and future return legs.
- Both booking services now expose hasUpcomingConfirmedBookings. Hotel eligibility uses checkout after UTC today. Neither API supplies shared transaction/confirmation ordering yet.
- ACC-07a + GEN-07: admin reset already exists; agree its sanitized audit event and failure/recovery semantics with Arwa.

Exactly whom to contact

- Ismail + Osama + Hicham: session-aware eligibility and a confirmation/deactivation fence, including late webhooks. Require a concurrency test proving a booking cannot become confirmed after deactivation.
- Arwa: password-reset audit producer. Kiki + Hicham + Osama: deactivated-author hiding/anonymization and existing private-owner boundaries.

Useful work now

- Prepare ACC-12 contract and isolated concurrency tests using the now-existing APIs before the agreed cross-module change.
- Demonstrate ACC-07 in a development SMTP test inbox using private local settings.
- Synchronize and finish the saved ACC-02 branch; keep enforcement off until mail readiness and internal booking/webhook integration are complete.
- Implement already-approved BON-02 as a standalone addon reusing hotel/public-itinerary readers without editing teammates' modules.

Evidence and log

- Test fail-closed eligibility, ongoing stays, return legs, confirmation races, session invalidation and deactivated-author visibility. Preserve admins' lack of private-itinerary access.
- Continue docs/work-logs/16003651.md. ACC-10 navigation and UI portions of ACC-19 remain M2.

PERSON 2 / ARWA / 16002483

Administration and shared services

Accounts, moderator assignments, admin booking views, post/comment/review reports/moderation, notification inbox and audit foundations are merged.

Remaining mandatory work

- R5 / GEN-07: suspension is committed before audit persistence. An injected audit failure leaves SUSPENDED; retry returns 409 without recovering audit/notification. Make the combined action durable or explicitly recoverable.
- GEN-09/10: add itinerary reporting/existence/hide/delete integration with Kiki. ContentModerationService currently rejects itineraries as unsupported. Preserve private and hidden-content boundaries.
- GEN-01: finish booking-confirmation/cancellation and flight schedule-change producers with Ismail, Osama and Gamila. Preserve existing account/provider and refund notifications.
- GEN-07: coordinate missing admin-reset/provider-creation audit producers with Malak, Gamila and Lama. Never log credentials.

Dependencies and tests

- Osama + Lama: coordinate provider/room deactivation with admission and existing reservations (R3/R4).
- Test audit failure plus request retry, one correct audit/mutation outcome and recoverable notification delivery.
- Test itinerary report uniqueness and author/admin/other-user hidden visibility. Verify each required event reaches the correct own inbox.
- ACC-17 flight/hotel explicit views exist. Agree whether a combined default is wanted before changing it; that is a contract question, not a demonstrated access flaw.

Log and optional work

- Append ACC-17, reporting/moderation and current integration/review outcomes to docs/work-logs/16002483.md; current headings stop at the earlier GEN-07 through ACC-13 checkpoint.
- After mandatory completion: GEN-01-B SMTP notifications/invitations, then BON-01 analytics with booking/payment owners.

PERSON 3 / GAMILA

Airlines, flights and search

Core provider/flight/cabin/search and assigned-airline booking reads exist. PR59 adds the multi-airport provider and seed:airports command.

Fix the new integration

- R2 / FLT-12 + ITN-26: real compiled helper offers CAI-to-LHR outbound with only LGW-to-CAI return; actual booking summary rejects that pair with 400. Map/filter compatible choices and test multiple airports with Kiki.
- Same-day returns: the service allows equal dates with a temporal filter, but the public flight DTO requires a strictly later return date. Align the agreed contract and test times on the same date.
- R1: exported adapter is not bound by ItinerariesModule. Coordinate replacement with Kiki; preserve merged pagination rather than duplicate search.

Other mandatory criteria

- FLT-01 + GEN-08: server-stored JPG/PNG logo upload, one logo, up to 5 MB, served by URL. External logo URL alone is insufficient.
- FLT-05 + GEN-01: confirmed-passenger schedule-change notifications through Arwa's service.
- FLT-06: real cancellation/refund/notification integration with Ismail/Hicham/Arwa.
- FLT-29: remaining seats per category/cabin and scoped passenger CSV; retain existing assigned-airline booking read and safe projections.
- GEN-07: agree airline-creation audit producer with Arwa.

Evidence and log

- Test actual itinerary-to-flight-to-booking compatibility: multi-airport, same-day, no reverse leg, pagination and sold-out cases. Verify logo limits, scope, seat counts, CSV and inbox delivery.
- Create docs/work-logs/<confirmed-student-id>.md. No Person 3 log exists in this snapshot. Record PR59 and the real checks/review outcome.

PERSON 4 / ISMAIL

Flight booking and inventory

Holds, confirmation/reference, e-ticket, owned reads and cancellation foundations exist.

Mandatory fixes and production wiring

- FLT-22 + PAY-01: replace pending payment binding so hold expiry cancels the real PaymentIntent.
- FLT-23 + GEN-01: connect confirmation to stored inbox notifications. The current debug logger does not deliver them.
- FLT-26 + PAY-03: activate real cancellation refunds and notifications; agree refund-status projection on booking details with Hicham.
- FLT-26 departure race: current quote checks departure before awaiting airline policy, but final cancellation filters only booking ID/status. The previously reproduced race remains in unchanged relevant source. Revalidate at the transactional state transition and test a delay crossing departure.

Shared interfaces

- ACC-12 with Malak/Osama/Hicham: future-leg eligibility exists; add agreed confirmation/deactivation ordering and session-aware checks.
- FLT-05/06/29 with Gamila: affected-passenger notification queries, provider cancellation and scoped CSV/read helpers.
- PAY-03 with Hicham: authoritative refund state, retry/idempotency and amount/currency boundaries.

Evidence and log

- Test actual production module composition, not only substituted ports: expiry/payment cancellation, confirmation/notification, user/provider cancellation/refund and repeated/late webhooks.
- Add deterministic departure-boundary and concurrent account-deactivation/confirmation tests.
- Create docs/work-logs/<confirmed-student-id>.md. No Person 4 log exists in this snapshot; include key prompts, decisions and actual checks/review outcomes.

PERSON 5 / LAMA / 16002622

Hotels, rooms and availability

Basic profiles, rooms, blocked/booked inventory, policies and search exist. HTL-22 now uses real multi-room reservation summaries.

Fix reproduced behavior first

- R4 / HTL-06: assigned moderator deactivates a room with a PENDING reservation (204). Coordinate atomic protection with Osama.
- R6 / HTL-12: four guests + maxPrice=1500 returns a quote of 1000 from a capacity-one room, although the qualifying room costs 20000. Quote/filter/sort a valid room selection.
- R7 / HTL-11: impossible 2027-02-30 and past 2020-01-01 check-in return 200. Enforce strict calendar/past-date validation and city OR country search.

Other mandatory workbook criteria

- HTL-01/02 + GEN-08: photos (up to five JPG/PNG, 5 MB each, server storage), star class, amenities, ratings/reviews and dated-room detail.
- HTL-03: type, beds and hotel-local unique room names; agree new shared fields with Osama.
- HTL-04/05/06: positive non-overlapping bookable intervals and reservation-safe edits/blocking/deactivation. Preserve frozen prices; if hard deletion is exposed, allow only never-reserved rooms.
- HTL-08: paginated Available / Booked-with-reference / Blocked view. HTL-15: type, beds, total-stay price and pagination.
- HTL-12: minimum-rating filter and rating sorting using Osama's aggregates. HTL-09 reservation snapshots now exist; HTL-10 cancellation application still needs Osama/Hicham. GEN-07 hotel-creation audit needs Arwa.

Dependencies, checks and log

- Osama + Arwa: R3 stale hotel-active admission and R4 reservation protection; agree consumption of positive availability.
- Test valid-capacity prices, dates, country-only search, uniqueness, pagination and concurrent mutations. Update docs/work-logs/16002622.md: its HTL-22 stub description is outdated.

PERSON 6 / OSAMA / 16005523

Hotel reservations and reviews

Grouped lists, UTC checkout completion/upcoming eligibility, atomic ten-minute holds/expiry, reviews, ratings and moderation hooks are merged.

Mandatory work remaining

- HTL-17 + PAY-01/02: payable booking/policy interface, verified-payment confirmation, one reference and atomic all-room HELD-to-BOOKED conversion. The hotel confirmation/payment path is not implemented.
- HTL-21 + PAY-03: eligible pre-check-in whole-reservation cancellation, tier refunds, room release, refund status/link and notifications.
- HTL-18 + GEN-01: connect expiry to pending PaymentIntent cancellation and appropriate events with Hicham/Arwa.
- R3 / ACC-15: deactivation after preflight but before the hold transaction still yields HTTP 201 PENDING. Agree atomic admission/deactivation ordering with Lama/Arwa.

Keep and connect the agreed contracts

- Lama: protect pending/confirmed reservations (R4); reconcile positive availability and preserve price/policy snapshots.
- Hicham: HOTEL payment port both ways, correct minor/major units, late-success compensation and idempotent confirmation.
- Malak + Ismail + Hicham: ACC-12 check exists, including ongoing stays via checkout after UTC today. Add shared confirmation ordering.
- Retain approved HTL-22 rooms[]/guestCount/bookingReference and pages of ten; do not revive the old single-room shape.

Evidence and log

- Test real payment confirmation, repeated/late webhooks, all-room rollback, expiry, whole cancellation/refund and restored availability. Test provider/room/account deactivation races.
- Preserve review eligibility, uniqueness, owner edits and rating recomputation. Continue docs/work-logs/16005523.md; recent holds work is already recorded. Optional later: HTL-26 moderator replies.

PERSON 7 / KIKI / 16001313

Itineraries and budgeting

CRUD/days/activities/media, budgets/FX, visibility/search/clone and real ITN-25 hotel search exist. ITN-28 export is merged as an additive module.

Mandatory integration work

- R1 / ITN-26: import/bind the exported real flight adapter instead of PendingFlightSearchAdapter. Valid real HTTP requests still return 503.
- With Gamila, fix R2 return-airport compatibility and same-day date handling. Verify city airport selection, itinerary default dates, passengers, empty results and global pagination.
- GEN-09/10 with Arwa: safe existence/hide/delete hooks and hidden author/admin visibility; itinerary moderation is still unsupported. Preserve ACC-11 private-owner access.
- BLG-12 with Hicham: public-only paginated author itineraries; exclude private/hidden/deactivated-author content.
- With Malak: settle supplied attractions catalog/schema/seed responsibility and official IDs. An optional attractionId field does not provision/validate the dataset.

Retain completed work

- ITN-25 reuses HotelsServiceSearchAdapter. Lama owns the underlying hotel defects; do not duplicate the search.
- ITN-28 PDF reuses getReadable for authorization and exports ordered days/activities/budgets/transport in recorded currencies. Do not reimplement it.
- Retain shared User/Currency/Country/City services and derived-day/reorder behavior.

Evidence and log

- Add real cross-module flight tests, not only fake-search criteria tests. Cover visibility, multi-airport and same-day returns, pagination, moderation and author exposure.
- Continue docs/work-logs/16001313.md; ITN-25 is recorded. Append the new integration and actual review outcome. Optional later: ITN-27 booking links; coordinate BON-02 with Malak.

PERSON 8 / OMAR HICHAM / 16002290

Payments, refunds and community

Core payment/refund/blog APIs, winning-charge/current-policy fixes, refund recovery fixes, blog race fixes and refund notifications are merged.

Mandatory integration work

- PAY-01/02 + HTL-17/21: connect Osama's real HOTEL lifecycle. FlightBookingsAdapter still returns null/false for all hotel calls; holds now exist, so its old comment is stale.
- Agree hotel policy snapshots, units/currency, verified all-room confirmation, expiry payment cancellation, cancellation/refund and late-success compensation with Osama.
- With Ismail/Arwa, activate production reverse booking payment/notification bindings. Importing FlightBookingsModule into payments does not replace its pending providers.
- PAY-03: authoritative refund state on booking details with both owners; explicit uncertain-external-outcome recovery and retry/idempotency checks. Preserve merged refund notifications.
- BLG-12 with Kiki: public author itineraries are missing; author name/join date/posts already exist.

Evidence still needed

- Demonstrate a real Stripe TEST-mode payment/refund through verified backend/webhook processing, with redacted evidence. Gateway-double tests do not certify real credentials/webhook registration. Never store raw card information.
- Test actual flight/hotel module composition: current policies, duplicate/late webhooks, expiry, cancellation/refund and notifications.
- Recheck broader uncertain-refund ordering with failure injection; previously fixed same-key persistence cases are not marked unfixed.

Completed fixes and log

- Existing regressions cover blog counter/child mutation and delete/upload race fixes; older audit notes must not reopen these as missing.
- Continue docs/work-logs/16002290.md, which records payment, blog-race and refund-notification work. Add integration and real test-mode outcomes. Optional later: BLG-13 attach itinerary, with Kiki.

OPTIONAL / ALL 11 WORKBOOK BONUSES

Choose bonuses after core integration

Prioritize small, independent additions and protect the testing/repair buffer.

Merged or ready to resume

- ITN-28: itinerary PDF, merged PR58. M2 download/print UI later.
- ACC-07: email recovery backend, merged PR55; demonstrate test-inbox delivery. Malak.
- ACC-02: saved unmerged at 83a4523. Previously corrected 21 focused tests pass; synchronize, regress and finish internal booking/webhook checks. Default enforcement off. Malak.
- BON-02: approved, unimplemented standalone Favorite. userId; exactly one hotelId/itineraryId; timestamps; unique owner/target; owner-only pages of ten. Malak can work without editing teammate modules.

Smaller owner options after mandatory work

- HTL-26: moderator review replies. Osama, with assignment/visibility checks.
- BLG-13: itinerary attached to post. Hicham + Kiki, with visibility/deletion agreement.
- GEN-01-B: SMTP notifications and moderator invitations. Arwa; reuse the agreed mail service/configuration.

Larger integrations

- ITN-27: booked flights/hotels linked to days/budget. Kiki + booking owners; stable hotel lifecycle first.
- BON-01: provider booking/revenue analytics. Arwa + financial/booking owners; agree paid/refunded totals and period.
- FLT-27: change confirmed flight/date with fare adjustment. Ismail + Gamila + Hicham.
- FLT-28: seat selection. Ismail + Gamila; agree seat/inventory schema.
- Optional cloud deployment appears in the project PDF; no invented workbook ID is assigned here.

ACCEPTANCE AND NEXT CHECKPOINT

What each owner sends back

One clear feature or related group per PR into develop, with reproducible checks and an honest log.

Required handoff

- Completed/partial requirement IDs; branch/PR; shared contracts changed and named consumers; Swagger DTO/error output and ten-row pagination.
- Exact build/test commands/results. Cover valid/invalid, guest/wrong role, ownership, data changes and relevant concurrency/retry cases. Mark external checks NOT RUN when applicable.
- Update the one continuous docs/work-logs/<confirmed-student-id>.md. Record important prompts, decisions, failures/corrections, checks, understanding and review outcome. TA acceptance of this placement instead of the PDF's AI_PROMPTS.txt still needs confirmation; this review does not restore a second log.

Evidence and scope

- Reviewed source: f9742f7. PR59 description/changes/tests and current hotel/itinerary integrations checked. Official matrix retains 104 mandatory and 11 bonus requirement texts/source cells.
- R1/R3/R4/R6/R7: real HTTP and isolated local MongoDB; R3 adds a deterministic barrier after preflight. R2/R5: real compiled services with controlled doubles. Diagnostic scripts/results are ignored local artifacts.
- No shared Atlas mutation, actual SMTP delivery, real Stripe payment/refund or real FX call is certified. No teammate source rewrite, force push or protected-branch implementation.

Proposed schedule; confirm official submission time

- 9-10 November: acknowledge checklists, settle interfaces, fix priority cases and update logs.
- 11-13 November: finish mandatory backend paths and review owner PRs.
- 14-16 November: real-module integration and clean setup/seeds, retry/failure/concurrency checks.
- 17-19 November: fixes, demo, records and release review. Confirm the previously discussed 20 November M1 deadline/time against the official course notice.
- Promote accepted stable develop to main through a milestone-release PR. Local main can match origin/main while develop contains newer features.

Repository: Travel Planning and Booking Platform. Matrix and this handoff describe the stated snapshot; new PRs require a new checkpoint.
